## QUALITY

Motorola's goal of acceptable quality is at Six Sigma or no more than 3.4 defects per million opportunities. Motorola Lighting Inc. designed its electronic ballast to meet the most rigorous performance standards at world class levels. This translates into a highly robust product that goes through extensive environmental stress testing to assure our customers of very low initial defect levels (less than 0.1%) and high reliability (greater than 500,000 hours Mean Time to Failure—MTTF).

The economic ballast life is 20 years when operated at 45°C ambient temperature. Operation of MLI's ballast at 50°C may derate life expectancy by 25%.

Six Sigma Quality means "world class" in all that we do at Motorola Lighting Inc., which is part of our commitment to TOTAL CUSTOMER SATISFACTION.

even without clearing, thermal reflectors lose less than 3% of their effectiveness annually in a five-year period in normal office environments. Spectrally selective clearing reflectors with a tint of 2% still dropped in warm water and lost 10% of their effectiveness annually. Clearing reflectors return to 99% of their original reflectivity after being submerged in water for 24 hours.

**The Tint Test Helped Finance Your Program.** The Tint Test was a key factor in the success of the Minnesota - a Division of 3M - Product Funding for customers who use thermal reflectors. Because a thermal privacy curtain is made of thermal reflectors, it can be tested for its ability to reflect heat back into a room. The Tint Test is a key test for products that use thermal reflectors.

## EXIT SIGN COST COMPARISON

### MODEL 101 SELF-LUMINOUS SIGN VS ELECTRICAL SIGNS

#### 10 YEAR COSTS:

	AC/DC Battery 2 x PL7 Lamps	AC/DC Battery 2 x 25w Lamps	SHIELD Model 101
Fixture (1)	120	80	
Labor & Material (1)	80	80	15
<u>INITIAL INSTALLED COST:</u>	<u>200</u>	<u>160</u>

<u>TOTAL COSTS AFTER 10 YRS:</u>	<u>\$932</u>	<u>\$1,937</u>	<u>\$</u>

TO COMPARE COSTS, INSERT YOUR QUOTE FOR SHIELD SIGNS IN COLUMN 3.

*Based on above and assuming SHIELD sign average cost is \$200 installed, if you now have 50 Exit signs operating with 25w lamps over 10 years, and we include the cost of a new SHIELD sign in 1998 at \$256 installed (inflation at 2.5% per yr) YOU COULD SAVE \$96,394! Even with current "power and labor saving" exits with PL7 lamps, savings will be \$46,144!*

#### NOTES:

- (1) Average 1987 Fixture costs: Electrical contractor labor at \$30/hr: Material includes typical pipe, wire, & circuit breaker: If new load center needed, add to material costs.
- (2A) Two 7 watt PL7 lamps/sign, 24 hrs/day at \$0.10/kwh.
- (2B) Two 25w lamps/sign, 24 hrs/day at \$.10/kwh.
- (3A) 10,000 hr lamps, 9 changes of 2 lamps/sign, lamp at \$8.00 ea.
- (3B) 750 hr lamps, 115 changes of 2 lamps/sign, lamp at \$.50 ea.
- (4) Lamp replacement, 15 min/sign, labor \$10.00/hr.
- (5) Battery costs estimated for a change every 2½ years per sign or 4 changes at a cost of \$55.00/unit. The cost per battery will vary as to type of battery installed. This estimate also assumes no failure of charger or transfer circuits.
- (6) Battery maintenance and replacement per (7) above, 4 changes per sign, 1 hr/sign, labor at \$10.00/hr.
- (7) Inflation 2.5% per year applied to operating and maintenance costs for electric signs after installation.

#### 4 PROGRAMMING DOCUMENT - ECIP PROJECT 2

---

The existing dual temperature water pumps in buildings 6942 and 6943, respectively fifteen and ten horsepower, operate at a constant speed for 8760 hours per year. The addition of variable speed drives and two-way control valves will allow the speed of the pumps to be varied, thus varying the system water flow. The two-way control valves will be retrofitted to the fan coil units that are served by the pumps. The throttling action of the two-way control valves at non-peak loads will allow the system to reduce flow without reducing pressure. The water flow will be varied to match the system heating or cooling load. Water in excess of that required to meet the heating or cooling demand will not be pumped.

Currently, the diesel fired generators at the water treatment plant and the Boiling Springs Pump Station are only run during periods of power interruption or to test the generators. During all other periods the treatment plant and pump station operate on power purchased from the utility company. The proposed construction will consist of new controls linking the generators to the Post Energy Management Control System. The new controls will allow for the remote operation of the generators and include start-stop capability. The generators will be used to meet the electric load for the respective plants during periods of the Post's peak electrical demand.

The Energy Management Control System (EMCS) extension and expansion will include adding fifteen buildings to the current Post EMCS. The EMCS will provide for remote monitoring, night setback, and start/stop capability for each piece of equipment that is connected to the system. The project extends and expands the EMCS to fifteen buildings. The buildings are building 80, 2702, 2840, 3069, 3071, 3934, 5380, 6627, 6636, 6921A, 7243, 7262, 7264, 7268, and 7272.

The project will save 1162 MBTU/year of energy and \$143,125. The annual recurring non-energy savings (3B on LCCA) is -\$10,400. The \$10,400 is added maintenance expense due to the increased operation of the generators.

This section contains the programming documentation for ECIP Project 2, peak-shaving generators, variable speed circulation pumps and EMCS expansion. Included are the project development brochures, 1391 forms, life cycle cost analysis, cost estimates for each building, and energy calculations for each building. Catalog cut sheets are included as an appendix to the document (located at the end of this section) to represent the replacement products.

OBJECTIVE:

The objective of this project is to install variable speed drives, expand the Energy Management and Control System (EMCS) and add controls to use existing generators for peak shaving. The improvements will reduce energy consumption and life cycle operating costs for the subject facilities in accordance with the Army Energy Resources Management Plan (ERMP) and Executive Order 12759.

<p><b>10. DESCRIPTION OF PROPOSED CONSTRUCTION</b></p> <p>The existing dual temperature water pumps in buildings 6942 and 6943 operate in a constant speed manner 8760 hours per year. The addition of variable speed drives will allow the speed of the pumps to be varied, thus varying the system water flow. The water flow will be varied to meet the system heating or cooling load. Water in excess of that required to meet the heating or cooling demand will not be pumped.</p> <p>Currently, the diesel fired generators at the water treatment plant and the Boiling Springs Pump Station are only run during periods of power interruption, or to test the generators. The proposed construction will consist of new controls linking the generators to the Post Energy Management Control System. The new controls will allow for the remote operation of the generators and include start-stop capability. The generators will be used to the electric of the respective plants during periods of the Post's peak electric demand.</p> <p>The Energy Management Control System (EMCS) extension and expansion will include adding fifteen (15) buildings to the current Post EMCS. The EMCS will provide for remote monitoring and start-stop capability for each of the building systems that are connected to the system.</p> <p>The implementation of this project will save 1162 MBtu/Yr of electrical energy. The first year savings is \$143,125 and the Savings to Investment Ratio (SIR) is 3.33.</p> <p><b>11. The proposed project will reduce annual energy consumption by 1162 MBTU/YR and annual energy cost by \$143,125.</p> <p>Current Situation: The existing dual water temperature pumps in buildings 6942 and 6943 operate 8760 hours per year at a constant flow and speed. <p>SPECIAL REQUIREMENTS PARAGRAPH 3 (SRP-3):</p> <p>Energy Requirements Appraisal (ERA)</p> <ol style="list-style-type: none"> <li>1. Project Description: Add variable speed drives, two-way valves and EMCS to existing facilities.</li> <li>2. Estimated Energy Consumption: The pumps currently operate at constant flow and speed. The generators and buildings are not presently connected to the EMCS. 1162 MBtu/Yr of energy can be saved by implementing the project.</li> <li>3. Energy Sources: No new energy sources are required for the proposed project. The use of solar energy for this project is impractical.</li> <li>4. Energy Use Impacts: The proposed project will substantially reduce the consumption of electricity and fuel oil. The burden on the existing base distribution system will be lessened.</li> <li>5. Energy Conservation: The proposed project will reduce annual energy consumption by 1162 MBtu/Yr with annual energy cost savings of \$143,125. The project complies with Army Resources Management Plan (ERMP) and Executive Order 12759.</li> <li>6. Energy Alternatives: The proposed project represents the greatest possible reduction in energy consumption, 1162 MBtu/Yr. The current levels do not exceed the levels recommended by ASHRAE.</li> <li>7. Energy Effects: The proposed project provides positive environmental effects. It reduces the current energy consumption by 1162 MBtu/Yr, effectively reducing the consumption of non-renewable fuel sources. The degrading of environmental standards would not make more efficient energy sources available.</li> <li>8. Basis of Approval: Total energy requirements and alternative fuel sources have been considered and included in this appraisal or discarded as applicable.</li> </ol>

## PROPOSED ENERGY USAGE

### HEATING: DEGREE DAY METHOD

SEE SHEET (B-1) FOR DEGREE DAY FORMULA EXPLANATION.  
BY LOWERING SPACE HEATING SETPOINTS DURING UNOCCUPIED  
HOURS WITH THE ENERGY MANAGEMENT AND CONTROL SYSTEM  
(EMCS), THE FOLLOWING SAVINGS ARE ACHIEVED:

$$\text{EXISTING DESIGN } \Delta T = (68 - 4) = 4^{\circ}\text{F}$$

$$\text{PROPOSED SETBACK } \Delta T = (-4) = 0^{\circ}\text{F}$$

$$\begin{aligned} \text{SETBACK BUILDING HEAT LOAD} &= \frac{\text{DESIGN HEAT LOAD}}{\text{DESIGN } \Delta T} * \text{PROPOSED } \Delta T \\ &= \frac{(1.2 \times 10^6) \frac{\text{BTU}}{\text{HR}}}{(68 - 4)^{\circ}\text{F}} * (50 - 4)^{\circ}\text{F} \end{aligned}$$

$$\text{SETBACK BUILDING HEAT LOAD} = 0.9 \times 10^6 \frac{\text{BTU}}{\text{HR}}$$

NOW USING THE DEGREE-DAY FORMULA FOR THE PROPOSED SETBACK CONDITION:

$$\begin{aligned} \text{PROPOSED HEATING ENERGY USAGE} &= \frac{\left( \frac{\text{SETBACK HRS}}{\text{DAY}} \right) (4290^{\circ}\text{F-DAY}) \left( \frac{\text{SETBACK BUILDING HT. LOAD}}{\text{HT. LOAD}} \right) (0.6)}{24 (68 - 4)^{\circ}\text{F}} + \frac{\left( 24 - \frac{\text{SETBACK HRS}}{\text{DAY}} \right) (\text{BASELINE HEATING ENERGY})}{24 \frac{\text{HR}}{\text{DAY}}} \\ &= \frac{(12 \text{ HRS}) 4290 (0.9 \times 10^6 \frac{\text{BTU}}{\text{HR}}) (0.6)}{(0.65) (64)} + \frac{(24 - 12) (1782 \times 10^6)}{24} \end{aligned}$$

$$\text{PROPOSED HEATING ENERGY USAGE} = 1559 \times 10^6 \frac{\text{BTU}}{\text{YR}} (\text{NATURAL GAS})$$

$$\text{AUXILIARY ENERGY SAVINGS} = \text{BASELINE AUX. ENERGY} - \text{PROPOSED AUX. ENERGY}$$

$$\text{AUX. ENRG. SAVINGS} = 27.8 \times 10^6 \frac{\text{BTU}}{\text{YR}} \left( \text{FROM SHEET B-1} \right) - \left[ 25 \text{ HP} * 2545 * 0.6 \left( \frac{\text{DIV. FACTOR}}{\text{FACT}} \right) * 4369 \right]$$

$$\text{AUX. ENERGY SAVINGS} = 111 \times 10^6 \frac{\text{BTU}}{\text{YR}} \quad \text{TOTAL ENERGY SAVINGS} = 334 \times 10^6 \frac{\text{BTU}}{\text{YR}}$$

HEATING: DEGREE DAY METHOD

$$\text{HEATING ENERGY (BTU/YR)} = \frac{24 * DD * \dot{q}}{\eta * \Delta T} * C_D$$

WHERE: DD = DEGREE DAYS - °F-DAY

$\dot{q}$  = BUILDING DESIGN HEAT LOAD - BTU/HR

$\eta$  = HEATING SYSTEM EFFICIENCY

$\Delta T = (T_{\text{INDOORS}} - T_{\text{OUTSIDE}})_{\text{DESIGN}} = (68 - 4)^\circ \text{F}$

$C_D$  = CORRECTION FACTOR BASED ON 65° DD

$$\text{HEATING ENERGY} = \frac{\left(24 \frac{\text{HR}}{\text{DAY}}\right) (4290^\circ \text{F-DAY}) \left(1.4 \times 10^6 \frac{\text{BTU}}{\text{HR}}\right)}{(0.45) (68 - 4)^\circ \text{F}} (0.6)$$

## PROPOSED ENERGY USAGE

BLDG #  
2702

### HEATING: DEGREE DAY METHOD

SEE SHEET (B-1) FOR DEGREE DAY FORMULA EXPLANATION.  
BY LOWERING SPACE HEATING SETPOINTS DURING UNOCCUPIED  
HOURS WITH THE ENERGY MANAGEMENT AND CONTROL SYSTEM  
(EMCS), THE FOLLOWING SAVINGS ARE ACHIEVED:

$$\text{EXISTING DESIGN } \Delta T = (68 - 4) = 4^{\circ}\text{F}$$

$$\text{PROPOSED SETBACK } \Delta T = (-4) = 0^{\circ}\text{F}$$

$$\begin{aligned} \text{SETBACK BUILDING HEAT LOAD} &= \frac{\text{DESIGN HEAT LOAD}}{\text{DESIGN } \Delta T} * \text{PROPOSED } \Delta T \\ &= \frac{(1.4 \times 10^6) \frac{\text{BTU}}{\text{HR}}}{(68 - 4)^{\circ}\text{F}} * (50 - 4)^{\circ}\text{F} \end{aligned}$$

$$\text{SETBACK BUILDING HEAT LOAD} = 1.0 \times 10^6 \frac{\text{BTU}}{\text{HR}}$$

NOW USING THE DEGREE-DAY FORMULA FOR THE PROPOSED SETBACK CONDITION:

$$\begin{aligned} \text{PROPOSED HEATING ENERGY USAGE} &= \frac{\left( \frac{\text{SETBACK HRS}}{\text{DAY}} \right) (4290^{\circ}\text{F-DAY}) \left( \frac{\text{SETBACK BUILDING HT. LOAD}}{\text{HT. LOAD}} \right)}{24 \frac{\text{HR}}{\text{DAY}}} (0.6) + \frac{(24 - \frac{\text{SETBACK HRS}}{\text{DAY}}) (\text{BASELINE HEATING ENERGY})}{24 \frac{\text{HR}}{\text{DAY}}} \\ &= \frac{(12 \text{ HRS}) 4290 \left( 1.0 \times 10^6 \frac{\text{BTU}}{\text{HR}} \right)}{(0.65) (64)} (0.6) + \frac{(24 - 12) (2079 \times 10^6)}{24} \end{aligned}$$

$$\text{PROPOSED HEATING ENERGY USAGE} = 1782 \times 10^6 \frac{\text{BTU}}{\text{YR}} \text{ (NATURAL GAS)}$$

AUXILIARY ENERGY SAVINGS = BASELINE AUX. ENERGY - PROPOSED AUX. ENERGY

$$\text{AUX. ENRG. SAVINGS} = 67.9 \times 10^6 \frac{\text{BTU}}{\text{YR}} \left( \text{FROM SHEET B-1} \right) - \left[ 61 \text{ HP} * 2545 * 0.4 \left( \frac{\text{DIV.}}{\text{FACTOR}} \right) * 4369 \right]$$

$$\text{AUX. ENERGY SAVINGS} = 272 \times 10^6 \frac{\text{BTU}}{\text{YR}} \text{ (ELEC)} \quad \text{TOTAL ENERGY SAVINGS} = 569 \times 10^6 \frac{\text{BTU}}{\text{YR}}$$
